C.Species: Genorhabditis elegans
C.Species: 29-Oct-1999 #teat_change 29-Oct-1999
C.Accession: T32844
R.Pu. Z.; Godala, D.
submitted to the EMBL Data Library, December 1997
A.Description: The Sequence of C. elegans cosmid KOSF6.
A.Reference number: Z21233
A.Accession: T3284
A.Status: preliminary; translated from GB/EMBL/DDBJ
A.Redicule type: DNA
A.Residues: 1-753 < DUZ>
A.Ccoss-references: EMBL:AF040653; PIDN:AAB95025.1; GSPDB:GN00020; CESP:KOSF6.5
A.Experimental source: strain Bristol N2; clone KOSF6

Suburi: Forms part of the receptor complex that consists of at least 8 different proteins (TOMS, TOMS, TOMS, TOM2, TOM20, TOM32, TOM37, TOM40 AND TOM70). Interacts with FOM20 and TOM70 (By similarity). SUBCELLULAR LOCATION: Type II membrane protein. Mitochondrial
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       "The mitochondrial receptor complex: a central role of MOM22 in mediating preprotein transfer from receptors to the general insertion
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           DOMAIN: Its cytoplasmic domain associates with the cytoplasmic domains of TOMA20 and TOM70. Its intermembrane space domain provides a trans binding site for presequences and the single membrane anchor is required for a stable interaction between the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  MEDLINE-93351229; PubMed-8348615;

-!- FUNCTION: REQUIRED FOR THE ROTATION OF THE FLAGELLAR MOTOR. MIGHT
BE A LINKER THAT FASTENS THE TORQUE-GENERATING MACHINERY TO THE
CELL WALL (BY SIMILARITY).

-!- SUBGELLULAR LOCATION: Type II membrane protein. Inner membrane.
-!- SIMILARITY: BELONGS TO THE MOTB FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              MEDITIRE 9295987, PubMed=9634230;

1 Biol. Chem. 267:5442-5445 (1992).

1 Biol. Chem. 267:5442-5445 (1992).

1 FUNCTION: PARTICIPATES IN THE REGULATION OF THE ACCUMULATION OF ITS OWN MRNA.

1 MISCELLANEOUS: THERE ARE TWO GENES FOR L4 IN YEAST.

1 SIMILARITY: BELONGS TO THE L4E FAMILY OF RIBOSOWAL PROTEINS.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Mature 399:353-358(1998).

-!-CATALYTIC ACTIVITY: 10-formyltetrahydrofolate + 5-amino-1-(5-phospho-D-ribosyl)imidazole-4-carboxamide - tetrahydrofolate + 5-formamido-1-(5-phospho-D-ribosyl)imidazole-4-carboxamide.

-!-CATALYTIC ACTIVITY: IMP + H(2)O = 5-formamido-1-(5-phospho-D-ribosyl)imidazole-4-carboxamide.

-!-CATALYTIC ACTIVITY: IMP + H(2)O = 5-formamido-1-(5-phospho-D-ribosyl)imidazole-4-carboxamide.

-!-PATHWAY: De novo purine biosynthesis; ninth step.

-!-PATHWAY: De novo purine biosynthesis; tenth step.

-!-PATHWAY: THE IMP CYCLOHYDROLASE ACTIVITY RESIDES IN THE N-TERMINAL REGION (BY SIMILARITY: BELONGS TO THE PURH FAMILY.
                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       STRAIN=VF5;

conserved protein motif with the T locus.";
Nat. Genet. 7:383-389(1994). -!-SUBCELLULAR LOCATION Nuclear (Potential).
-!-SUBCELLULAR LOCATION Nuclear (Potential).
-!-TISSUE SPECIFICITY: IN ADULTS, HIGHEST LEVELS IN LUNG. ALSO FOUND IN HEART, KIDNEY, AND OVARY.
-!-DEVELOPMENTAL STAGE: EXPRESSION FIRST OBSERVED AT DAY 9.5 IN THE OTIC AND OPPIT VESICLES AND IN THE FACIAL REGION, AT DAY 12.5, EXPRESSED IN THE TRIGEMINAL GANGLIA, FACIAL REGIONS, RETINA AND LIMB BUD MESENCHYME. IN LATER STAGES, FOUND IN EAR PINNAE, THE MILK LINE, LUNG MESENCHYME, BODY WALL. GENITAL RIDGE AND DEVELOPING NERVOUS SYSTEM.
-!- SIMILARITY: CONTAINS 1 T-box domain. Gaps DEVELOPMENTAL EXPRESSION.

                                       "Novel phosphotransferase-encoding genes revealed by analysis of the Bacherichia coll genome: a chimeric gene encoding an Enzyme I homologue that possesses a putative sensory transduction domain."; Gene 181:103-108(1996).

-! FUNCTION: TOULD FUNCTION IN TRANSCRIPTIONAL REGULATION OF SIGMA-54 DEPENDENT OCOLLD FUNCTION WITH THE NPR (PTSO) AND IIA-NTR (PTSN) PROTEINS THEREBY PROVIDING A LINK BETWEEN CARBON AND NITROGEN ASSIMILARORY PATHWAYS.

-! CATALYTIC ACTIVITY: Phosphoenolpyruvate + protein L-histidine = pyruvate + protein N(pi)-phospho-L-histidine.

-! SUBCELLULAR LOCATION: Cytophasmic (Probable).

-! SIMILARITY: BLONGS TO THE PEP-UTILIZING ENZYMES FAMILY.

-! SIMILARITY: BLONGS TO THE PEP-UTILIZING ENZYMES FAMILY.

Submitted (AUG-1990) to the EMBL/GenBank/DDBJ databases.

C I- PUNCTION: The glycine cleavage system catalyzes the degradation of glycine. The glycine of alabha-amino group of glycine through its pyridoxal phosphate cofactor; CO(2) is released and the remaining methylamine molety is then transferred to the lipoamide cofactor of the H protein.

C -- CATALYTIC ACTIVITY: Glycine + lipoylprotein = S-

aminomethyldihydralipoylprotein + CO(2).

C -- COFACTOR: Pyridoxal phosphate.

C -- COFACTOR: Pyridoxal phosphate.

C -- SIBUNIT: HOWDIMER: THE GLYCINE CLEAVAGE SYSTEM IS COMPOSED OF COUR PROTEINS: P, T, L, AND H.

C -- SUBCELLULAR LOCATION: Mitcohndrial.

C -- SIMILARITY: TO OTHER GLYCINE CLEAVAGE SYSTEM P-PROTEIN.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This SWISS-PROT entry is copyright. A method for the large-scale cloning of nuclear proteins and nuclear

trargeting sequences on a functional basis.";

Anal. Blochem. 284:231-239 (2006)

- 1- FUNCTION: Insulin-regulated facilitative glucose transporter.

- SUBGUNIT: Binds to DAXX (By similarity).

- SUBGELLUTAR LOCATION: Integral membrane protein. Localizes

primarily to the perinuclear region, undergoing continued

recycling to the plasma membrane where it is rapidly

reinternalized. The dileucine internalization motif is critical

for intracellular sequestration (By similarity).

- IPTM: Sumoylated (By similarity).

Submitted (APR-2001) to the EMBL/GenBank/DDBJ databases.
-!- CATALYTIC ACTIVITY: 2 pyruvate = 2-acetolactate + CO(2).
-!- PATHWAY: Valine and isoleucine biosynthesis; first step.
-!- SUBUNIT: DIMER OF LARGE AND SMALL CHAINS (BY SIMILARITY).
-!- SIMILARITY: BELONGS TO THE ACETOLACTATE SYNTHASE SMALL SUBUNIT PAMILY.
Acetolactate synthase small subunit (EC 2.2.1.6) (AHAS) (Acetolactate synthase small subunit (EC 2.2.1.6) (AHAS) (Acetolactate synthase small subunit) (ALS).

Direct Submission

Submitted (09-JUL-2002) 1, D-85764 Neuherberg, GERMANY
Clone from S. Wiemann, Molecular Genome Analysis, German Cancer
Research Center (DKF2); Email s wiemann@dki2-heidelberg.de;
sequenced by BMFZ (Biomedical Research Center at the Charite,
Berlin/Germany) within the CDNA sequencing consortium of the German
Genome Project.

This clone (DKFZp54/Pi613) is available at the RZPD in Berlin.
Please contact the RZPD: Resourcenzentrum, Heubnerweg 6, 14059
Berlin-Charlottenburg, GERMANY; Email: clone@rzpd.de Further
information about the clone and the sequencing project is available
at http://mips.gsf.de/proj/CDNA/.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          * NOTE: This is a 'working draft' sequence. It currently consists of 18 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as * runs of N, but the exact sizes of the gaps are unknown. * This record will be updated with the finished sequence as soon as it is available and the accession number will * be preserved.
                              Sequencing vector: M13, 98%
Sequencing vector: M13, 98%
Chemistry: Dye-primer ET; 98% of reads
Chemistry: Dye-terminator Big Dye; 2% of reads
Assembly program: Phrap; version 0.990319
Consensus quality: 188825 bases at least Q40
Consensus quality: 202103 bases at least Q30
Consensus quality: 203934 bases at least Q20
Insert size: 219000; agarose-fp
Insert size: 219000; agarose-fp
Insert size: 206730; sum-of-contigs
Quality coverage: 4.27 in Q20 bases; agarose-fp

Class 1: Function experimentally demonstrated in P. aeruginosa.

Class 2: Function of highly similar gene experimentally demonstrated in another organism (and gene context consistent in terms of pathways its involved in, if known).

Class 3: Function proposed based on presence of conserved amino acid motif, structural feature or limited sequence similarity to an experimentally studied gene.

Class 4: Homologs of previously reported genes of unknown function, or no similarity to any previously reported sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       /db xxef="taxon:208964"

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This represents the February 3, 2003 version of the continually updated, reviewed, Peudomonas aeruginosa PAOI genome annotation, from PseudocAP (see http://www.pseudomonas.com for latest updates and links to alternate annotations). PseudocAP is coordinated by Fiona S.L. Brinkman (Simon Fraser University, Canada) and Robert E.W. Hancock (University of British Columbia, Canada) we welcome submission through www.pseudomonas.com of any proposed changes.
                                                                                                                       Bacteria; Proteobacteria; Gammaproteobacteria; Pseudomonadales;
Pseudomonadaceae; Pseudomonas.
